Problem 1

The graphs appear to be quite noisy.

All graphs show even desynchronization clearly with RawC3 Right and Raw C4, Left showing higher signal levels.

For Event synchronization Both channels of left hand have good indication, so does RawC3 Right hand, but for RawC4 right hand, base line power is almost the same signal strength as power of the signal. Hence it can be difficult to classify.

Problem 2

They look very identical. I think I had a slightly different looking graph at one point which look slightly cleaner. But the general observations are similar to that of problem 1.

Problem 3

No figure cannot talk about it. I was having indexing issues at the end. Before that many different issues.
